Topic 11: Lasso

by Sai Zhang

**Key points:** 

Disclaimer:

Lasso (Least absolute Shrinkage and Selection Operator), proposed by Tibshirani (1996), aims to minimize the SSR (sum of residual squares) subject to the L1-norm (sum of the absolute value) of the coefficients being less than a constant.

## 11.1 Set up

For data  $(\mathbf{x}_i, y_i)_{i=1}^n$ , where

- $y_i$  is the outcome for individual i
- $\mathbf{x}_i = (x_{i1}, \dots, x_{ip})'$  is the  $p \times 1$  vector of predictors

Then the Lasso estimator  $\left(\hat{\alpha},\hat{\pmb{\beta}}\right)$  is defined as

$$\left(\hat{\alpha}, \hat{\boldsymbol{\beta}}\right) = \arg\min_{\alpha, \beta} \left\{ \sum_{i=1}^{n} \left( y_i - \alpha - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 \right\}$$
 s.t. 
$$\sum_{j=1}^{p} |\beta_j| \le t$$

## 11.2 Penalized Least Square Estimation

Lasso is one special class of Penalized Least Square (PLS) Estimation,
